Thermal Condensation Reactions of Some Lignin Related Compounds

**Condensation reactions of some lignin related compounds
at relatively low pyrolysis temperature**

Takeshi Nakamura, Haruo Kawamoto* and Shiro Saka

Graduate School of Energy Science, Kyoto University, Kyoto, Japan

ABSTRACT

Condensation reactions of some lignin related compounds were studied under the pyrolysis conditions (air / 250°C / 2h). Guaiacol, 4-methylguaiacol and 4-methylveratrole were recovered almost quantitatively with small amount of radical coupling products derived from phenoxy and benzyl radicals. Side-chains ($C_{\alpha}=C_{\beta}$, $C_{\alpha}-OH$) increased the condensation reactivity substantially. From the dimer structures, vinyl condensation and quinone methide mechanisms were indicated as important condensation pathways for these compounds. As for model compounds for the structures formed in lignin primary pyrolysis, coniferyl alcohol (from β -ether structure) was very reactive, while 4,4'-dihydroxy-3,3'-dimethoxystilbene (from β -aryl structure) was stable.

INTRODUCTION

Pyrolysis is the underlying principle of thermochemical conversion processes of plant biomass including gasification, fast pyrolysis (bio-oil production) and carbonization. Understanding the pyrolysis mechanism on molecular basis is very important to understand the overall pyrolysis behavior and to improve the product selectivity.

Thermogravimetric study^[1] indicated that lignin pyrolysis proceeds in a wide temperature range. Our previous study^[2] showed that condensation occurs at 200-250°C followed by substantial depolymerization (>300-350°C) and carbonization (polycyclic aromatic hydrocarbon formation) (>350-400°C) in 1 min pyrolysis of Japanese cedar milled wood lignin (MWL) in nitrogen. Furthermore, from the comparison with the model compound reactivity, phenolic α -ether, β -ether and β -aryl types of model compounds became reactive at the temperature where condensation of MWL was observed.^[2] Phenolic β -ether and β -aryl types of model compounds formed the $C_{\alpha}=C_{\beta}$ types of products, coniferyl alcohol and

Thermal Condensation Reactions of Some Lignin Related Compounds

4,4'-dihydroxy-3,3'-dimethoxystilbene, respectively.^[2,3] Thus, these types of structures would also be important in this low temperature condensation.

In this paper, condensation reactions of several lignin related compounds at 250°C are discussed from their polymerization reactivities and the structures of the isolated dimers.

EXPERIMENTAL

Thin layer chromatography (TLC, Merck silica gel 60 PF₂₅₄) was conducted to separate the compounds. ¹H-NMR spectrum was measured with a Bruker AC-300 (300 MHz) spectrometer. Chemical shifts and coupling constants are shown as δ and J (Hz) values, respectively. High-performance liquid chromatography (HPLC) was carried out with a Shimadzu LC-10A under the conditions [column: Shimadzu STR ODS-II, flow rate: 0.7 ml/min, eluent: binary gradient 30% (v/v) to 100% (v/v) MeOH/H₂O in 40 min and then isocratically at 100% for another 5 min, detector: UV_{280nm}, temperature: 40°C]. Gel-permeation chromatography (GPC) was conducted with a Shimadzu LC-10A under the following condition [column: Shodex KF-801, flow rate: 0.6 ml/min, eluent: THF, detector: UV_{280nm}, temperature: 40°C]. Gas-chromatography/mass-spectroscopy (GC-MS) was conducted with a Hitachi G-7000 gas chromatograph and a Hitachi M-9000 3-dimensional quadrupole mass spectrometer; gas-chromatographic

Thermal Condensation Reactions of Some Lignin Related Compounds

conditions: column: Shimadzu CBP5-M25-O25, injector temperature: 250°C, column temperature: 50°C to

300°C in 25 min and then isocratically at 300°C for another 15 min, carrier gas: He, flow rate: 1.5 ml/min;

mass-spectroscopic conditions: emission current: 20μA, ionization time: 25 ms.

Materials

Figure 1 summarizes the lignin related compounds used in this study. Guaiacol (2-methoxyphenol, **1**) is a model of the aromatic nuclei of guaiacyl type lignin, and compounds **2-10** have various side-chains [$-\text{CH}_3$ (**2,3**), $-\text{CH}(\text{OH})\text{CH}_3$ (**4,5**), $-\text{CH}=\text{CH}_2$ (**6,7**), $-\text{CH}=\text{CH}-\text{CH}_2\text{OH}$ (**8,9**) and $-\text{CH}=\text{CH}-(4\text{-guaiacyl})$ (**10**)] including phenolic and non-phenolic forms. Coniferyl alcohol [4-(3-hydroxy-1-propenyl)-2-methoxyphenol, **8**] and 4,4'-dihydroxy-3,3'-dimethoxystilbene (**10**) are the primary pyrolysis products from phenolic β -ether and β -aryl types of model compounds, respectively, at 200-400°C.^[2,3] Guaiacol (**1**), creosol (2-methoxy-4-methylphenol, **2**) and coniferyl alcohol (**8**) were purchased from Nacalai tesque INC as guarantee grades. 4-Vinylguaiacol (**6**) was prepared by the method described by Griengl *et al.*^[4] 4-Methylveratrole (1,2-dimethoxy-4-methylbenzene, **3**) and 4-vinylveratrole (1,2-dimethoxy-4-vinylbenzene, **7**) were prepared by methylation of the corresponding phenolic derivatives with MeI and K_2CO_3 in DMF at r.t. 4-(1-Hydroxyethyl)guaiacol (**4**) and

Thermal Condensation Reactions of Some Lignin Related Compounds

4-(1-hydroxyethyl)-1,2-dimethoxybenzene (**5**) were prepared by reduction of 4-hydroxy-3-methoxyacetophenone and 3,4-dimethoxyacetophenone, respectively, with NaBH₄ in THF at r.t. Coniferyl alcohol methyl ether (**9**) was obtained through methylation (MeI / K₂CO₃ / DMF / r.t.) and subsequent reduction (NaBH₄ / THF / r.t.) from coniferyl aldehyde. 4,4'-Dihydroxy-3,3'-dimethoxystilbene (**10**) was prepared by the method reported by Gierer and Nilvebrant.

[5]

Pyrolysis and Product Analysis

Pyrolysis was conducted in an ampoule (2.0 ml) made of glass. Lignin related compound was placed at the bottom of the ampoule by evaporating the solution in dioxane *in vacuo* and the ampoule was closed in the air. The ampoule was inserted into a stainless autoclave filled with silicon oil, and the autoclave was heated in a silicon oil bath at 250°C for 2 h. After quenching the reaction by immediate cooling in cold water for 10 min, the ampoule was opened and extracted with ethyl acetate (5.0 ml). The resulting solution was analyzed with HPLC and GPC. Identification of the products was conducted with ¹H-NMR spectra of the isolated compounds. Recovery of the starting compound and the product yield were determined from the HPLC chromatogram with *p*-dibromobenzene as an internal standard. Data of the

Thermal Condensation Reactions of Some Lignin Related Compounds

isolated products were shown as follows.

2,3'-Dimethoxy-4'-hydroxydiphenyl ether (11), *3,3'-dimethoxy-4,2'-biphenyldiol (12)* and *3,3'-dimethoxy-4,4'-biphenyldiol (13)*

Guaiacol (**1**) (0.20 ml) gave pale brown oil by evaporating the ethyl acetate solution of the reaction mixture (250°C / 2h). The oil was separated with TLC (ethyl acetate / *n*-hexane = 1/2, v/v, solvent A) to give compounds **11** (1.1 mg), **12** (1.9 mg) and **13** (0.8 mg).

Compound **11**: ¹H-NMR (CDCl₃) δ: 3.82 (s, 3H, -OCH₃), 3.86 (s, 3H, -OCH₃), 5.17 (s, 1H, -OH), 6.43 (dd, *J*=2.7, 8.6, 1H, C₆-H), 6.63 (d, *J*=2.7, 1H, C₂-H), 6.8-7.2 (m, 5H, arom.-H). GC-MS *m/z*: 78 (10%), 138 (50%), 172 (15%), 204 (18%), 247 (100%, [M + H]⁺).

Compound **12**: ¹H-NMR (CDCl₃) δ: 3.90 (s, 3H, -OCH₃), 3.92 (s, 3H, -OCH₃), 5.61 (s, 1H, -OH), 5.83 (s, 1H, -OH), 6.83 (dd, *J*=2.0, 7.7, 1H, C₄- or C₆-H), 6.88 (t, *J*=7.7, 1H, C₅-H), 6.94 (dd, *J*=2.0, 7.7, 1H, C₄- or C₆-H), 6.96 (d, *J*=8.3, 1H, C₅-H), 7.08 (dd, *J*=1.9, 8.3, 1H, C₆-H), 7.14 (d, *J*=1.9, 1H, C₂-H). GC-MS *m/z*: 172 (9%), 204 (28%), 217 (12%), 233 (15%), 247 (100%, [M + H]⁺).

Compound **13**: ¹H-NMR (CDCl₃) δ: 3.93 (s, 6H, -OCH₃), 5.57 (s, 2H, -OH), 6.94 (d, *J*=7.9, 2H, C₅-, C₅-H), 7.00 (br. s, 2H, C₂-, C₂-H), 7.01 (dd, *J*=1.9, 7.9, 2H, C₆-, C₆-H). GC-MS *m/z*: 161 (15%), 189 (23%), 204

Thermal Condensation Reactions of Some Lignin Related Compounds

(77%), 232 (54%), 247 (100%, $[M + H]^+$).

2-Methoxy-6-(2-methoxy-4-methylphenoxy)-4-methylphenol (**14**) and

2,4'-dihydroxy-3,3'-dimethoxy-5-methyldiphenylmethane (**15**)

Heat treatment (250°C / 2h) of creosol (**2**) (0.20 ml) gave pale brown oil after evaporation of the ethyl acetate solution. Compounds **14** (0.7 mg) and **15** (0.9 mg) were isolated from the oil by TLC (solvent A).

Compound **14**: $^1\text{H-NMR}$ (CDCl_3) δ : 2.18 (s, 3H, arom.-CH₃), 2.31 (s, 3H, arom.-CH₃), 3.83 (s, 3H, -OCH₃), 3.86 (s, 3H, -OCH₃), 5.77 (s, 1H, -OH), 6.31 (d, $J=2.0$, 1H, C₃-H), 6.44 (d, $J=2.0$, 1H, C₅-H), 6.68 (dd, $J=2.0$, 8.0, 1H, C₅-H), 6.77 (d, $J=2.0$, 1H, C₃-H), 6.86 (d, $J=8.0$, 1H, C₆-H). GC-MS m/z : 77 (11%), 92 (15%), 123 (100%), 275 (69%, $[M + H]^+$).

Compound **15**: $^1\text{H-NMR}$ (CDCl_3) δ : 2.21 (s, 3H, arom.-CH₃), 3.83 (s, 3H, -OCH₃), 3.83 (s, 2H, arom.-CH₂-), 3.84 (s, 3H, -OCH₃), 5.42 (s, 1H, -OH), 5.52 (s, 1H, -OH), 6.48 (d, $J=2.0$, 1H, C₄-H), 6.53 (d, $J=2.0$, 1H, C₆-H), 6.7-6.9 (m, 3H, C₂-, C₅-, C₆-H). GC-MS m/z : 106 (7%), 121 (15%), 137 (6%), 150 (50%), 226 (5%), 275 (100%, $[M + H]^+$).

3,3',4,4'-Tetramethoxybibenzyl (**16**) and *3,4,3',4'-tetramethoxy-6-methyldiphenylmethane* (**17**)

Thermal Condensation Reactions of Some Lignin Related Compounds

Compounds **16** (0.5 mg) and **17** (0.5 mg) were isolated from the heat treatment mixture of 3,4-dimethoxytoluene (**3**) (92.3 mg) at 250°C for 2h (TLC, solvent A).

Compound **16**: ¹H-NMR (CDCl₃) δ: 3.86 (s, 6H, -OCH₃), 3.88 (s, 6H, -OCH₃), 4.60 (d, *J*=4.0, 4H, arom.-CH₂-CH₂-), 6.8-7.0 (m, 6H, arom.-H). GC-MS *m/z*: 51 (15%), 65 (31%), 77 (39%), 107 (20%), 109 (36%), 139 (46%), 152 (38%), 168 (100%).

Compound **17**: ¹H-NMR (CDCl₃) δ: 2.17 (s, 3H, arom. -CH₃), 3.78 (s, 3H, -OCH₃), 3.79 (s, 3H, -OCH₃), 3.83 (s, 3H, -OCH₃), 3.85 (s, 3H, -OCH₃), 3.85 (s, 2H, arom. -CH₂-), 6.58 (dd, *J*=2.0, 8.0, 1H, C₆-H), 6.61 (s, 1H, C₃-H), 6.63 (d, *J*=2.0, 1H, C₂-H), 6.68 (s, 1H, C₆-H), 6.75 (d, *J*=8.0, 1H, C'₅-H). GC-MS *m/z*: 165 (21%), 228 (14%), 242 (11%), 272 (25%), 288 (38%), 302 (100%, M⁺).

1-(4-Hydroxy-3-methoxyphenyl)-3-(4-hydroxy-3-methoxyphenyl)-1-butene (18)

Heat treatment (250°C / 2h) of a mixture of 4-vinylguaiacol (**6**) (10mg) and creosol (**2**) (0.12 ml) gave brown oil. Separation of the oil by TLC (solvent A) gave compound **18** (0.7 mg).

Compound **18**: ¹H-NMR (CDCl₃) δ: 1.41 (d, *J*=7.0, 3H, C_β-H), 3.48 (m, 1H, C_α-H), 3.87 (s, 3H, -OCH₃), 3.88 (s, 3H, -OCH₃), 5.39 (s, 1H, -OH), 5.58 (s, 1H, -OH), 6.16 (dd, *J*=7.0, 16.0, 1H, C_β-H), 6.31 (d, *J*=16.0, 1H, C_α-H), 6.7-6.9 (m, 6H, arom.-H). GC-MS *m/z*: 163 (48%), 177 (20%), 211 (20%), 226 (37%),

Thermal Condensation Reactions of Some Lignin Related Compounds

255 (44%), 270 (42%), 287 (100%), 301 (82%, [M + H]⁺).

2-[1-(4-Hydroxy-3-methoxyphenyl)ethyl]-6-methoxy-4-methylphenol (19)

A mixture of 4-(1-hydroxyethyl)guaiacol (**4**) (10 mg) and creosol (**2**) (0.11 ml) gave brown oil after heat treatment (250°C / 2h). Compound **19** (1.0 mg) was separated from the oil by TLC (solvent A) (GC-MS *m/z*: 165 (100%), 275 (35%), 289 (5%, [M+H]⁺). Compound **19** was converted to the acetyl derivative under the conditions of acetic anhydride (0.2 ml) / pyridine (0.2 ml) / r.t. / overnight and purified with TLC (ethyl acetate / *n*-hexane = 1/2, *v/v*).

Compound **19** (acetate): ¹H-NMR (CDCl₃) δ: 1.52 (d, *J*=7.3, 3H, C_β-H), 2.21 (s, 3H, arom.-CH₃), 2.27 (s, 3H, acetyl-CH₃), 2.27 (s, 3H, acetyl-CH₃), 3.74 (s, 3H, -OCH₃), 3.77 (s, 3H, -OCH₃), 4.19 (q, *J*=7.3, 1H, C_α-H), 6.55 (d, *J*=2.0, 1H, arom.-H in creosol moiety), 6.61 (d, *J*=2.0, 1H, arom.-H in creosol moiety), 6.7-7.0 (m, 3H, arom.-H). GC-MS *m/z*: 164 (100%), 200 (17%), 274 (17%), 289 (91%), 331 (6%), 373 (6%, [M + H]⁺).

1-(4-Hydroxy-3-methoxyphenyl)-3-(2-hydroxy-3-methoxy-5-methylphenyl)-1-propene (**20**) and

4-hydroxy-3'-methoxy-8-methoxy-5-methylflavan (**21**)

Thermal Condensation Reactions of Some Lignin Related Compounds

Heat treatment (250°C / 2h) of a mixture of coniferyl alcohol (**9**) (65 mg) and creosol (0.65 ml) gave brown oil. Compounds **20** (13 mg) and **21** (9 mg) were isolated from the oil with TLC (solvent A and subsequently CHCl₃).

Compound **20**: ¹H-NMR (CDCl₃) δ: 2.26 (s, 3H, arom.-CH₃), 3.50 (dd, *J*=1.2, 1H, 6.8, C_γ-H), 3.87 (s, 3H, -OCH₃), 3.88 (s, 3H, -OCH₃), 5.69 (s, 1H, -OH), 6.21 (dt, *J*=6.8, 15.7, 1H, C_β-H), 6.38 (dt, *J*=1.2, 15.7, 1H, C_α-H), 6.58 (br. s, 1H, arom.-H in creosol moiety), 6.60 (br. s, 1H, arom.-H in creosol moiety), 6.82 (d, *J*=8.1, 1H, arom.-H), 6.86 (dd, *J*=1.6, 8.1, 1H, arom.-H), 6.89 (d, *J*=1.6, 1H, arom.-H).

Compound **21**: ¹H-NMR (CDCl₃) δ: 2.03-2.22 (m, 2H, C_γ-H), 2.27 (s, 3H, arom.-CH₃), 2.73 (dt, *J*=4.7, 16.5, 1H, C_β-H), 2.92 (ddd, *J*=6.0, 10.5, 16.5, 1H, C_β-H), 3.82 (s, 3H, -OCH₃), 3.87 (s, 3H, -OCH₃), 5.03 (dd, *J*=2.7, 9.4, 1H, C_α-H), 5.58 (s, 1H, -OH), 6.51 (br. s, 1H, arom.-H in creosol moiety), 6.56 (br. s, 1H, arom.-H in creosol moiety), 6.88-6.90 (m, 2H, arom.-H) 6.96 (br. s, 1H, arom.-H).

RESULTS AND DISCUSSION

Table 1 summarizes the recovery of starting compound and yields of some products after heat treatment of compounds **1-7** at 250°C for 2 h. Product yield is shown as a value based on monomer, and hence, yields of dimers other than compound **19** are twice as the molar yields of dimers. For compounds **4** and **6**,

Thermal Condensation Reactions of Some Lignin Related Compounds

heat treatment in creosol (**2**) (20 molar equivalent for compound **4** or **6**) were also conducted to enhance the formation of dimer fraction. Reactivity as indicated from the recovery varies significantly depending on the structure. Compounds **1-3** with no side-chain or only a methyl substituent group were very stable (recovery: ~100%), while compounds **4-7** with C_{α} -OH or $C_{\alpha}=C_{\beta}$ type of side-chain were comparatively very reactive as suggested from their relatively low recoveries (0-49.8%).

From compounds **1-3**, several dimeric products were isolated although their yields are very low. $^1\text{H-NMR}$ analysis revealed the aryl-aryl (**12**, **13**), aryl-*O*-aryl (**11**, **14**), diphenyl methane (**15**, **17**) and diphenyl ethane (**16**) structures. Coupling sites in these products were assigned with the coupling constants observed for the aromatic protons in their NMR spectra. Formation of these dimers strongly suggest the existence of various radical species derived from phenoxy and benzyl radicals as summarized in the formation mechanisms (Figs. 2 and 3). Consequently, some of the phenolic O-H and benzylic C-H bonds in compounds **1-3** are suggested to be dissociated at 250°C before radical coupling reactions occur, although their reactivities are not so high compared to the reactivity of compounds **4-7** with C_{α} -OH or $C_{\alpha}=C_{\beta}$ type of side-chain.

GPC chromatograms of the reaction mixtures obtained from compounds **4-7** are shown in Fig. 4. The $C_{\alpha}=C_{\beta}$ types **6** and **7** gave substantial amount of products in high molecular weight (MW) regions

Thermal Condensation Reactions of Some Lignin Related Compounds

regardless of their aromatic structures (phenolic vs. non-phenolic). Contrary to this, products from the C_{α} -OH types **4** and **5** are not observed in such high MW regions even in the phenolic form. These results suggest that $C_{\alpha}=C_{\beta}$ is an important structure rather than phenolic structure in thermal condensation of compounds **4-7**.

Although isolation of dimer from the reaction mixture obtained from the phenolic $C_{\alpha}=C_{\beta}$ type **6** was failed, dimer **18** (*trans* isomer) (8.0 %) was isolated from the reaction mixture after heating in 20 molar equivalent of creosol. Dimer **18**, which is a coupling product between C_{α} and C_{β} , was identified with the $^1\text{H-NMR}$ spectrum compared with the reported data.^[6,7] Stereochemistry (*trans* isomer) in dimer **18** was confirmed from the large coupling constant (16.0Hz) observed for the two protons attached to the double bond. Dimer **18** was reported in thermal decarboxylation of ferulic acid^[6,7] and cationic polymerization of 4-vinylguaiacol with strong acidic catalyst.^[8,9] Although polymerization mechanism (radical or cationic) is not known at the moment, formation of dimer **18** and high condensation reactivity of the non-phenolic type **7** indicate the vinyl condensation mechanism for the $C_{\alpha}=C_{\beta}$ types **6** and **7** (Fig. 5). Thermal polymerization of styrene has been reported in similar temperature ranges,^[10,11] and the condensation mechanism including self-initiation mechanism has been studied extensively.^[12,13] Reduced polymerization reactivity of compound **6** in creosol (recovery of **6**: 37.8%) would be due to the dilution

Thermal Condensation Reactions of Some Lignin Related Compounds

effect of creosol.

The C_{α} -OH types **4** and **5** gave the dehydration products **6** and **7** with $C_{\alpha}=C_{\beta}$ structure, respectively, and dimer **18** was also isolated from the phenolic form **4** (6.0%). These results indicate that vinyl condensation mechanism is also provable for the C_{α} -OH types via dehydration into $C_{\alpha}=C_{\beta}$ structures, although these polymerization reactivities are quite low compared to the $C_{\alpha}=C_{\beta}$ structures (GPC, Fig. 4).

From the reaction mixture of the C_{α} -OH type **4** in creosol, dimer **19** (9.0 %), which is a coupling product between C_{α} and the creosol- C_6 , was isolated. The coupling site was determined by the characteristic small *meta* coupling constant (2.0Hz) for the two aromatic protons of the creosol moiety in the ^1H -NMR spectrum of dimer **19** (acetate). Formation of dimer **19** suggests the quinone methide intermediate which is subject to the nucleophilic addition of creosol. This condensation pathway competes with the $C_{\alpha}=C_{\beta}$ formation and the following vinyl coupling (Fig. 6). However, relatively high yields of 4-vinylguaiacol (**6**) (41.9%) and its dimer **18** (9.0%) even in the presence of 20 molar equivalent of creosol suggest that the nucleophilic addition of aromatic nuclei to quinone methide is not so effective in compound **4**. Dimer **19** was not detected in heat treatment of the phenolic $C_{\alpha}=C_{\beta}$ type **6** in creosol.

As for model compounds formed from the β -ether and β -aryl types of structures, recoveries of coniferyl alcohol (**8**), coniferyl alcohol methyl ether (**9**) and 4,4'-dihydroxy-3,3'-dimethoxystilbene (**10**) in heat

Thermal Condensation Reactions of Some Lignin Related Compounds

treatment at 250°C for 2h are summarized in Table 2 with some isolated products. Although stilbene **10** was very stable (recovery: ~100%), coniferyl alcohol (**8**) (recovery: 0.9%) and its methyl derivative **9** (recovery: 6.8%) were comparatively very reactive and gave condensation products as indicated from the GPC chromatograms (Fig. 7). Especially, phenolic type **8** was quite reactive to give high MW products even after 1 min heating.

Although dimer fraction was difficult to be isolated from the reaction mixture of compound **8** or **9**, dimers **20** (12.0%) and **21** (8.3%) were isolated from the reaction mixture of coniferyl alcohol **8** in creosol. These dimers are the coupling products of coniferyl alcohol and creosol. Large coupling constant (15.7Hz) observed between the double bond protons indicates the *trans* isomer of compound **20**. Dimers **20** and **21** are expected to be formed via nucleophilic attack of creosol-C₆ and hydroxyl group in creosol moiety to quinone methide intermediates, respectively, as illustrated in Fig. 8.

Vinyl condensation is also possible in the coniferyl alcohol types **8** and **9**. However, much higher polymerization reactivity of the phenolic form **8** than the non-phenolic form **9** (GPC, Fig. 7) indicates that quinone methide formation, which is especially effective in phenolic form, is more important than the vinyl condensation. Lower polymerization reactivity of coniferyl alcohol methyl ether (**9**) than 4-vinylveratrole (**7**) as indicated from Figs. 4 and 7 would be due to higher steric hindrance around double bond in

Thermal Condensation Reactions of Some Lignin Related Compounds

compound **9**. In stilbene **10** (mp. 213-215 ^[15]), which was melt at 250°C, one aromatic ring is expected to be located perpendicular to the plane consisting of the other aromatic ring and C=C. Steric hindrance around double bond caused this conformation would be a reason for high stability of stilbene **10** compared to other lignin related compounds.

CONCLUSIONS

Vinyl condensation, quinone methide and radical coupling mechanisms have been indicated as condensation pathways of some lignin related compounds at 250°C. Although further study is necessary to discuss the condensation reaction occurring in lignin macromolecule, these results would give useful information to understand the relatively low temperature pyrolysis of lignin.

Legend of Figures and Tables

Figure 1. Lignin related compounds.

Figure 2. Dimerization mechanisms of guaiacol (**1**).

Figure 3. Dimerization mechanisms of creosol (**2**) and 4-methyl veratrole (**3**).

Figure 4. GPC chromatograms of the reaction mixtures obtained from the heat treatment of compounds **4-7** (air / 250°C / 2h).

* Retention time of compound **4**, **5**, **6** or **7**.

Figure 5. Condensation mechanism of the $C_{\alpha}=C_{\beta}$ types (**6** and **7**).

Figure 6. Condensation mechanism of the phenolic C_{α} -OH type (**4**).

Figure 7. GPC chromatograms of the reaction mixtures obtained from the heat treatment of compounds **8** and **9** (air / 250°C / 2h).

* Retention time of compound **8** or **9**.

Figure 8. Formation mechanism of dimers **20** and **21** from coniferyl alcohol with creosol.

Table 1. Recovery and yields of some isolated products in heat treatment of compounds **1-7** (air / 250°C / 2h).

Table 2. Recovery and yield of some isolated product in heat treatment of compounds **8-10** (air / 250°C / 2h).

	R ₁	R ₂
1	-H	-H
2	-CH ₃	-H
3	-CH ₃	-CH ₃
4	-CH(OH)CH ₃	-H
5	-CH(OH)CH ₃	-CH ₃
6	-CH=CH ₂	-H
7	-CH=CH ₂	-CH ₃
8	-CH=CH-CH ₂ OH	-H
9	-CH=CH-CH ₂ OH	-CH ₃
10	-CH=CH-Ar (Ar = 4-guaiacyl)	-H

Table 1. Recovery and yields of some isolated products in heat treatment of compounds **1-7** (air / 250°C / 2h).

Model compound	Recovery	Isolated products (yield, mol%)*		
1	~100%	 11 (0.6%)	 12 (1.0%)	 13 (0.4%)
2	~100%	 14 (0.3%)	 15 (0.4%)	
3	~100%	 16 (0.2%)	 17 (0.3%)	
4	0.3%	 6 (4.3%)	 18 (6.0%)	
4 + creosol (20 mol eq.)	39.2%	 6 (41.9%)	 18 (9.0%)	 19 (9.0%)
5	49.8%	 7 (8.0%)		
6	0.0%			
6 + creosol (20 mol eq.)	37.8%	 18 (9.0%)		
7	13.0%			

* based on monomer

Table 2. Recovery and yield of some isolated products in heat treatment of compounds **8-10** (air / 250°C / 2h).

Model compound	Recovery	Isolated products (yield, mol%)*
8	0.9%	
8 + creosol (20 mol eq.)	3.5%	<div>   </div> <div> 20 (12.0%) 21 (8.3%) </div>
9	6.8%	
10	~100%	

* based on monomer
